

Designation: C1850 – 17 (Reapproved 2025)

Standard Guide for Improved Laboratory Accelerated Tests to Predict the Weathering and for Use in Developing Protocols to Predict the Design Life of Building Sealant Systems¹

This standard is issued under the fixed designation C1850; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This guide describes the steps for developing improved laboratory accelerated weathering tests for predicting the natural weathering effects on building sealant systems and for using those tests in development of methods for design life prediction of the systems.

1.2 This guide outlines a systematic approach to development of laboratory accelerated weathering tests of building sealant systems including the identification of needed information, the development of accelerated tests, the application of data, and the reporting of results.

1.3 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

2. Referenced Documents

2.1 *ASTM Standards:*²

C717 Terminology of Building Seals and Sealants

G113 Terminology Relating to Natural and Artificial Weathering Tests of Nonmetallic Materials

3. Terminology

3.1 *Definitions*—For definitions of terms used in this guide, refer to Terminologies **C717** and **G113**.

3.2 *Definitions of Terms Specific to This Standard:*

3.2.1 *biological degradation factor*—degradation factors directly associated with living organisms, including microorganisms, fungi, and bacteria.

3.2.2 *building sealant system component*—a part of a building sealant system that may include a combination of building materials, such as cladding, substrates or the sealant.

3.2.3 *building sealant system material*—a material that may be used in a building sealant system.

3.2.4 *critical performance characteristic(s)*—a property, or group of properties, of a building sealant system that must be maintained above a certain minimum level.

3.2.5 *degradation mechanism*—the chemical reactions induced in a building component or material by one or more degradation factors resulting in changes in one or more of the critical performance characteristics.

3.2.6 *incompatibility factor*—any of the group of degradation factors that result from detrimental chemical and physical interactions between building components or materials.

3.2.7 *in-service test*—a test in which building components or materials are exposed to degradation factors under in-service conditions.

3.2.8 *performance criterion*—a quantitative statement of a level of properties for a selected characteristic of a component or material needed to ensure compliance with a functional requirement.

3.2.9 *property measurement test*—a test for measuring one or more properties of building components or materials.

3.2.10 *load stress factor*—any degradation factors that result from externally applied sustained or periodic mechanical loads.

3.2.11 *use factor*—any factor that affects the material as a result of the design of the system, installation and maintenance procedures, normal wear and tear, and user abuse. (Example: abrasion of foot traffic.)

3.2.12 *weathering factors*—any degradation factors associated with the natural environment, including radiation, temperature, rain and other forms of water, freezing and thawing.

4. Significance and Use

4.1 This guide is intended to serve as a reference of recommended methodology for users developing relevant, reliable and valid tests for predicting natural weathering effects

¹ This guide is under the jurisdiction of ASTM Committee **C24** on Building Seals and Sealants and is the direct responsibility of Subcommittee **C24.20** on General Test Methods.

Current edition approved Oct. 1, 2025. Published October 2025. Originally approved in 2017. Last previous edition approved in 2021 as C1850 – 17 (2021). DOI: 10.1520/C1850-17R25.

and for use in developing methods to determine design life of building sealant systems through the use of accelerated test protocols. The proposed standard corrects for some of the deficiencies of existing laboratory accelerated tests of sealants.

4.2 The development of accelerated weathering tests capable of being used in protocols to reliably and accurately predict the long-term in-service performance of building sealant systems have limitations due to:

4.2.1 The external factors that affect functional properties, which are numerous and require effort to quantify, so that many existing accelerated procedures do not include all factors of importance, and

4.2.2 The sealant specimens are often tested in configurations different from those used in-service.

5. Procedure

5.1 This guide describes a recommended sequence of steps for users to follow for developing laboratory accelerated weathering tests for predicting the effects of natural weathering

on sealants and for use in development of methods for estimating design life (see Fig. 1 for a flow chart).

6. Scope

6.1 The scope describes the intentions of the test and the degradation factors that should be included.

I–Problem Definition

7. Definition of In-Service Performance Characteristic Requirements and Criteria

7.1 The critical performance characteristic criteria define the minimum acceptable levels of in-service functional properties stated in terms of absolute values or changes from the initial test.

8. Characterization of the Sealant

8.1 Characterize the sealant system in terms of composition, critical performance characteristics, and physical properties the
