Hydraulic fluid power — Determination of pressure ripple levels generated in systems and components

Part 1: Method for determining source flow
ripple and source impedance of pumps

National foreword

This British Standard is the UK implementation of ISO 10767-1:2015. It supersedes BS ISO 10767-1:1996 which is withdrawn.

Attention is drawn to the fact that, during the development of this International Standard, the UK committee voted against its approval as an International Standard.

The UK committee is of the opinion that the method is not proven and needs to be tested by industry. The committee would have preferred an intermediate stage where both ISO 10767-1:1996 and ISO 10767-1:2015 are available while new the version is tried and tested, as the committee views the 1996 edition to be more robust.

The UK participation in its preparation was entrusted by Technical Committee MCE/18, Fluid power systems and components, to Subcommittee MCE/18/-/8, Product testing.

A list of organizations represented on this subcommittee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.
