Thermoplastics pipes for the transport of fluids — Determination of pendulum impact strength by the Charpy method —

Part 2:

Test conditions for pipes of various materials

*Tubes thermoplastiques pour le transport des fluides — Détermination de
la résistance aux chocs pendulaires par la méthode Charpy —*

*Partie 2: Conditions d'essai pour différentes matières constitutives de
tubes*

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 9854-2 was prepared by Technical Committee ISO/TC 138, *Plastics pipes, fittings and valves for the transport of fluids*, Subcommittee SC 5, *General properties of pipes, fittings and valves of plastic materials and their accessories — Test methods and basic specifications*.

ISO 9854 consists of the following parts, under the general title *Thermoplastics pipes for the transport of fluids — Determination of pendulum impact strength by the Charpy method*:

- *Part 1: General test method*
- *Part 2: Test conditions for pipes of various materials*

Annex A of this part of ISO 9854 is for information only.
